

• BUILD ON ARC • AGENTIC ECONOMY

Make every agent choice settle with *proof.*

h402 brings provider selection, USDC payment, and outcome evidence into one verifiable commerce loop on Arc.

PROVIDER CONTRACTS
AVAILABLE NOW

The current product discovers paid APIs, exposes native provider contracts, and keeps a recommended default visible to the agent.

Source: `h402-test.hunt.town` · captured 29 Jul 2026

An agent can pay for an API. But can it *prove it made the right choice?*

What h402 has already solved

01 Discovery

One mount exposes a growing set of provider-native API contracts.

02 Execution

Agents choose a provider and pay per call through the existing x402 flow.

03 Live evidence

Catalog quality signals and paid-test evidence inform a recommended default.

“Why this provider, for this task, under this budget?”

For autonomous commerce, the answer must survive beyond a UI recommendation. It needs a durable receipt, an attributable outcome, and a feedback loop.

THE ARC OPPORTUNITY

Turn provider selection from a transient marketplace event into an auditable, reusable trust signal.

A verification layer between *agent intent* and provider settlement.

Arc makes the receipt as usable as the payment.

USDC AS GAS

One asset for spend and settlement.

The agent policy can reason in the same unit that pays the provider and covers the transaction fee.

<1 SEC FINALITY

One confirmation becomes final evidence.

Receipts can safely trigger the next step in an agent workflow without a reorg or waiting window.

EVM COMPATIBLE

Build a compact verification contract fast.

h402 can use familiar Solidity tooling while remaining compatible with the wider Ethereum developer stack.

From decision to finality

Policy

USDC cap
task constraints

Arc receipt

choice + quote
outcome hash

Feedback

reputation
or job release

Arc Testnet gives the MVP a USDC-native settlement surface and deterministic finality for verifiable post-payment actions.

```
// Arc settlement receipt
decisionReceipt {
  agent: walletAddress,
  task: "web/search",
  policyHash: 0x...,
  provider: "tempo-firecrawl",
  quoteUSDC: 0.004,
  paymentRef: x402Receipt,
  outcomeHash: 0x...,
  evaluator: resultVerifier
}
```

Keep the information that makes a payment *explainable*.

The onchain record does not duplicate API output. It anchors the decision context and a tamper-evident reference to the observed result.

- + Selection policy and USDC limit make autonomous spend reviewable.
- + Provider, quote, and payment reference make the settlement traceable.
- + Outcome hash lets an evaluator attach quality feedback without exposing private payloads.

h402 is the *decision and evidence layer*, not another payment rail.

01 · CIRCLE

Agent Wallets

Wallet-controlled agents with clear spending boundaries and programmable policy context.

h402 uses it for
USDC budget authority

02 · PAYMENT

Nanopayments + x402

Short, service-level USDC payments remain an execution primitive supplied by the ecosystem.

h402 uses it for
Per-call provider settlement

03 · ERC-8004

Identity & reputation

Attach verifiable performance feedback to agents and providers after a paid call is evaluated.

h402 uses it for
Outcome-backed reputation

04 · ERC-8183

Job settlement

Extend from small calls to milestones, escrow, and evaluator-approved delivery for higher-value work.

h402 uses it for
Conditional job release

The result: **existing payment rails** plus a portable record of why an agent spent and what that spend achieved.

Every paid call can make the next choice *better.*

h402 turns one-off service payments into a repeatable feedback loop. Policies bound spending; receipts bind evidence; evaluators make outcomes useful to the market.

PRIVATE DATA STAYS OFFCHAIN
ONLY POLICY, REFERENCE, AND OUTCOME HASH
ARE ANCHORED

04 · REUSE

Improve future routing

Use outcome evidence to update provider reputation.

01 · DECIDE

Policy-bound choice

Evaluate eligible providers within a USDC ceiling.

03 · EVALUATE

Verify the outcome

Attach evaluator feedback to the completed task.

02 · SETTLE

Pay and anchor

Execute the call, then commit the decision receipt on Arc.

The marketplace already exposes *comparable provider choices*.

Catalog surface

Capabilities, provider choices, recommendation signals, and paid-test status are already visible in the current product.

Contract surface

A selected provider exposes a quote, performance signals, payment context, and a native request contract.

One mount today. *Verifiable autonomous spend* on Arc next.

CURRENT H402 DOCS

 **h402** by Hunt Town

CapabilitiesBuildersDocs

Connect wallet

DOCS

Call any capability. *Pay per call.*

h402 exposes every capability behind provider-pinned task endpoints. Your agent reads the current default once, keeps that provider pinned until it chooses another, and pays per call in Base USDC over x402 — no per-provider API keys, plans, or subscriptions.

[Call & pay](#)

For AI agents

The fastest way to onboard: tell your agent to read the skill and run a task. It creates a wallet, funds it with Base USDC, and starts calling tools on its own.

Claude

Codex

Cursor

Gemini

Current workflow

An agent reads h402's hosted skill, creates a wallet, discovers a capability, and pays per call without per-provider keys or plans.

Arc MVP extension

Before execution, h402 produces a policy-bound selection receipt; after execution, it anchors the outcome reference and exposes feedback.

◆ H402 · VERIFIED AGENT COMMERCE

10 / 12

A focused build that ends in a *working, inspectable flow*.

WEEK 01

Policy-aware routing

- Define task, USDC cap, and provider eligibility.
- Expose price, quality, latency, and availability inputs.
- Generate the signed decision payload.

OUTPUT · DECISION SCHEMA

WEEK 02

Pay + receipt on Arc

- Execute a selected provider call with the existing payment primitive.
- Deploy an Arc Testnet receipt contract.
- Record payment reference and outcome hash.

OUTPUT · ONCHAIN RECEIPT

WEEK 03

Outcome feedback

- Attach an evaluator result to the receipt.
- Map verified performance to ERC-8004 reputation.
- Prototype an ERC-8183 job path for larger tasks.

OUTPUT · TRUST LOOP

WEEK 04

Demo and handoff

- Show policy → selection → payment → proof.
- Publish Arc Testnet contract and public repository.
- Ship a short demo video and build notes.

OUTPUT · HACKATHON SUBMISSION

The MVP proves one claim end to end: **an agent's USDC spend can be attributable to a policy, a provider choice, and an observed outcome.**

● BUILDING FROM A LIVE AGENT MARKETPLACE

We are ready to make agent payments *verifiable*.

h402 combines an operating capability marketplace with product, engineering, and growth experience. On Arc, the team will turn current paid-call evidence into an interoperable trust primitive for agent commerce.

BUILD ON ARC

Verified Agent Commerce on Arc Testnet

- Use the live h402 marketplace as the initial provider and task surface.
- Anchor policy-bound decision receipts after USDC service payments.
- Demonstrate ERC-8004 feedback and an ERC-8183 expansion path.
